

SCS Verifies 349,786 mtCO₂e of GHG Emission Reductions from Bluesource's Improved Forest Management Project

Bluesource Offsets Emissions through Improved Forest Management

An expert in forestry, carbon capture and storage, transportation and energy efficiency, Bluesource chose SCS Global Services (SCS), a leading independent third-party verifier, to assess their Bishop Improved Forest Management Project for compliance with the Cap-and-Trade Regulation and U.S. Forest Projects Compliance Offset Protocol, and its offsets generated from June 24, 2014 to June 23, 2015.

“It is essential that the chosen verification body be as time efficient as possible. SCS' team provides this efficiency, consistently meeting deadlines while maintaining the highest standards of project evaluation.

– Josh Strauss, Vice President, Bluesource

SCS Verifies Project Offsets and Compliance

Located on 219,000 acres of forestland in Michigan's Upper Peninsula, the Project employs practices that will lead to significant increases in carbon stocks over time as compared to common practice in the region. Bluesource will continue to monitor and verify carbon reductions for 100 years after the issuance of offsets.

“Generating substantial volumes of carbon offsets on a yearly basis, Bishop is one of the most important forest projects in Bluesource's portfolio. Working with SCS on Bishop's second site verification proved to be a great decision as they provided top notch service, always keeping communication lines open and pushing hard to resolve issues in as timely a manner as possible.

– Ben Parkhurst, Director of Technical Services, Bluesource

**The Bishop Improved Forest Management Project achieved
349,786 mtCO₂e of Emission Reductions.**
